The manganese deposits of Czechoslovakia. F. Ulrich and R. Munk. *Schlagel u. Eisen* (1933); *Nouvel. Jahrb. Mineral. Geol., Ref. II*, 1933, 274. The Mn deposits of Kladno and Stalovice (Schwabenhof) yield 65% of Czechoslovakian production, and also some Ba and 1.58×10^{-4} g. Rn. Several other similar but smaller deposits occur in the Erzgebirge. (C. A. Schramm)

Title : Pneumoconiosis Induced by Inhalation of Talc Powder in
the Rubber Industry

Orig Pub : Pracovni lekar., 1956, 8, No 3, 175-177

Abstract : Description of a case of pneumoconiosis (extensive uni-
lateral fibrosis) in a rubber industry worker engaged in
preparation of rubber mixes (duration of employment 20
years). The air of the work area was found to contain
large amount of dust that consisted of talc, magnesia,
kaolin (5-10%), chalk, carbon black, SiO_2 (traces) etc.
(640-23000 particles per 1 cc). It is considered that
talc dust was the cause of pneumoconiosis.

1049. THE PROBLEM OF THE ACTION OF FLUORINE ON WORKERS IN AN ALUMINIUM FOUNDRY - Problém účinku fluóru na robotníkov v hliníkárni - Ulrich L. Úst. Hyg. Práce a Chor. z Povolania, Bratislava - PRACOV. LÉK. 1958, 10/6 (518-521)

The examinations of aluminium foundry workers so far completed show that considerable quantities of fluorine are absorbed by the organism as can be seen from the urinary fluorine excretion which on the average is 3-5 mg./l. urine. The excretion is thus estimated to amount to 5-6 mg., because in the hot surroundings where the electrolytic founding is done the daily excretion of urine is 1000-1200 ml. The F excretion is higher than the lower safety limit which is given as 5 mg./l. As skeletal changes take a long time to develop (10-15 yr.) great care must be taken when evaluating hitherto described positive findings. The potential hazard of fluorosis has, however, been proved and this makes preventive measures imperative. The affection of the Ca metabolism and the decreased urinary excretion of calcium must be further investigated. Satisfactory results can be expected, when as a result of effective health education 24-hour samples of urine will be obtained from the investigated workers. The main emphasis must be laid on systematic X-ray examinations of the skeleton according to a schedule (including pelvis, knee joints, and thoracolumbar spine) elaborated by the authors. The condition of the respiratory passages indicates a certain improvement as compared with the previous year's examinations as can be seen from the results of laryngological examinations and the low incidence of bronchitis in foundry workers exposed to noxious substances in aluminium plants for 5 yr. Immobility of the chest in cases with a negative pulmonary finding should be checked objectively by means of an expiration curve. In a single case with impaired mobility of the chest which was found, the condition was due to pulmonary emphysema and not to fluorine intoxication.

"Sanitary Problems in the Manufacture of Fireproof Materials."

Prague, Pracovni Lekarstvi, Vol 15, No 3, April 63, pp 100 - 104.

Abstract [Author's English summary modified]: A relationship between dust content in air and impaired health of workers is shown. The author shows that damage to lungs does not depend only on free SiO_2 but also on the mass of inactive dust. The dust of magnesite although inert is dangerous. The author recommends periodic check-ups of operating personnel in dangerous areas.

"Glycols and their Derivatives."

Prague, Pracovni Lekarstvi, Vol 15, No 7, 1963, pp 299-306

Abstract: The authors offer first the definition of the chemicals described; they list their general chemical behavior and properties and mention their main industrial uses. They give their general physiological properties and applications. The following compounds are discussed: Ethyleneglycol, propyleneglycol, butyleneglycol, hexyleneglycol, diethyleneglycol, dipropyleneglycol, triethyleneglycol, polyethyleneglycol, butoxypolypropyleneglycol, polypropyleneglycol, glycol monoacetates, methylglycol monoacetate, ethylglycol acetate, ethyleneglycol monoacetate, propylene glycol acetate, methyl-1,3-butyleneglycolacetate, ethyl-triethylene glycol acetate, glycol di-acetate, diethyleneglycol di-acetate, propyleneglycoldiacetate, ethylacetyl glycolacetate, ethyleneglycolmonomethylether, mono-, di-, and tri-propyleneglycolmethylether, dipropylglycolmethylether, ethyleneglycolmonoethylether, diethyleneglycolmonoethylether, ethyleneglycolmonobutylether, diethylene

TITLE: Optimal statistical sampling plans for a certain type of plant

SOURCE: Kybernetika, no. 5, 1965, 421-430

TOPIC TAGS: quality control, automatic control theory

ABSTRACT: The determination is investigated of an optimal statistical sampling plan for quality control in a plant of which it is assumed that the percentage of rejects is p when the plant is in order, and 100 percent when it is out of order. The probability that the plant may go out of order is q , but when the plant is out of order it cannot return by itself to the state of proper operation; n is the number of products not checked; m is the number of products checked; c is the maximum permissible number of rejects in m . The costs of quality control and of repairing the installation, and the losses from letting rejects go through are known. A sampling plan is sought that offers the minimum unit cost, with or without ensuring the given percentage of rejects. Orig. art. has: 10 formulas and 1 table. Title : Evaluation of Seed Qualities According to Their Physico-Mechanical Properties

Orig Pub : Vest. s.-kh. nauki, 1957, No 6, 84-94

Abstract : This paper gives data on the evaluation of seed qualities of wheat of the Goldeiforme 189 variety. This wheat belonged to the harvests of 1944, 1945, 1947 and 1953-1955, obtained by the All Union institute of mechanization by sifting. The existence of a new device, a screen classifier to determine the gage of the grain, is reported.

TITLE: The solution of thermal shocks on paper R-C analogons [Presented by:
Engineer and Candidate of Sciences Ludck Krejci]

SOURCE: Strojnický časopis, no. 5, 1966, 492-506

TOPIC TAGS: thermal shock, temperature gradient, turbine blade, reactor
pressure vessel, model, RC model

ABSTRACT: A solution is made of the problem of determining non-stationary
temperatures and temperature gradients, which arise in parts of energetic
machines at thermal shocks. For the solution, R-C models are used. The basic
theory of the electrothermal analogy of unsteady fields is given and three typical
examples of thermal shock are solved, i. e., in a plate, in a turbine blade, and in a
reactor pressure vessel. Orig. art. has: 9 figures and 23 formulas. [Authors'

TITLE: Design of plates reinforced with ribs

PERIODICAL: Strojirenství, v.12, no.9, 1962, 651-659

TEXT: Welded structures are being used more and more extensively in connection with low pressure bodies, on large steam turbines, condensers, heat exchangers and various other vessels. By using thin walls or plates, reinforced with ribs, light strong designs can be obtained. This paper gives a theoretical analysis of one such basic structural element, i.e. plate stiffened up with a regular pattern of ribs. It shows that, by choosing correct geometrical proportions, its weight can be appreciably lowered whilst maintaining adequate strength. The basis of the author's analysis is formed by the differential equation for anisotropic plates:

$$D_x \frac{\partial^4 w}{\partial x^4} + 2H \frac{\partial^4 w}{\partial x^2 \partial y^2} + D_y \frac{\partial^4 w}{\partial y^4} = q(x, y) \quad (1)$$

where D_x and D_y are the bending strengths of the plate of unit width whose cross-section is normal to the direction of Card 1/4

Z/032/62/012/009/001/002
E160/E435

Design of plates ...

axes x and y respectively, w is the deflection of the plate; H is the torsional strength which is usually expressed in terms of $\sqrt{D_x \cdot D_y}$, the appropriate factor being determined either theoretically or empirically, q is the pressure intensity on the plate. Methods which are available for the general solution of this equation are laborious and lengthy. Some simplifying assumptions were therefore made: the pitch of the ribs is the same in both directions, i.e. $D_x = D_y = D$ and $H = \sqrt{D_x \cdot D_y}$. This reduces the above equation to

$$\frac{\partial^4 w}{\partial x^4} + 2 \frac{\partial^4 w}{\partial x^2 \partial y^2} + \frac{\partial^4 w}{\partial y^4} = \frac{q}{D} \quad (6)$$

for which the solutions are available for any given pressure intensity and type of support. A further assumption introduced is an outside hydrostatic pressure for which $q(x,y) = \text{constant}$. The remainder of this analysis is aimed at obtaining a relation between the basic geometrical parameters h , t , s and H , i.e. thickness of the plate and pitch, thickness and height of the ribs. Such relation must be consistent with the bending strength

Card 2/4

direction of axes x and y , which is inversely proportional to the pitch of ribs in these directions. Although the given theory does not appreciate the influence of all the possible factors, it leads to an economic design and appreciable savings in materials. There are 10 figures and 1 table. ✓

Title : A Contribution to the Problem of So-called Valves in
Umbilical and Placental Vessels.

Orig Pub : Ceskoslov. gynaekol., 1956, 21/35, No 1, 50-55

Abstract : A study was made of 136 human umbilici and placentae, some of them (40) by means of injections after delivery. No circular folds or valves (valvulae Hobokenii) exist in umbilical or placental vessels before birth. The folds appear after birth as a result of contractions of the muscles of the umbilical and placental vessels, and may disappear later. Their development may also be explained by physical laws: when the umbilical artery is filled under a pressure of 30-200 mm Hg constrictions and typical folds
